

Cheshire region Biodiversity Action Plan

Species Action Plans

The list below details the species currently included on the Cheshire region BAP. The 'UK BAP Status' denotes whether each species is currently included on the revised (2007) UK List of Priority Species and Habitats. Those species not included on the UK list are referred to as local species.

The 'Action Status' determines whether the plan is currently 'active' or 'archived'. Active status is applied where current and future actions are required to achieve defined SMART targets. Archived status applies to those species where no current action is required in the region. The distribution of species included in archive plans is monitored closely by rECOrd. The archived plans may become active in the future if the distributions of the species changes or opportunities arise for conservation action.

UKBAP Review 2007

In June 2007 the Biodiversity Reporting and Information Group (BRIG) submitted a report to the UK Biodiversity Partnership detailing the results of the UKBAP Review. The report includes the revised UK List of Priority Species and Habitats which contains 1149 species and 65 habitats. From this list those species and habitats occurring in Cheshire region but not currently included in the local BAP are summarised below. UK targets for these species and habitats are awaited along with guidance on the action required although the BRIG report suggests that actions for the majority of these additional species will be included in a relevant habitat action plan. Therefore there is no intention at this stage to develop new actions plans for all habitats and species listed below but just to highlight those relevant to the region.
